Complementary DNA was synthesized from mRNA using a primer consisting of a poly(df) sequence with a XNoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The CDNA fragments were directioned into the EcoNI. About restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (GibcoBRL). This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DGVGSKTEKTLIDFGAGYAKSNRSTCKSCMEKIDKGQVRLSKKVVYPDKPQLGMVDCW
                                                                                                                                                                                                                                                                                                                                                                                               Zinc-binding finger motifs are observed in seq. 21-51 and 128-165. The sequences, 200-220 and 250-270, showed helix-turn-helix structure. Nucleotide-binding fold was found in seq. 890-903. Location/Qualifiers
poly(ADP-ribose) synthetase: evolutionally conserved segments and their potential functions
